

# Sloan Digital Sky Survey III: *mapping the Universe on the largest scales*

1. The largest multicolor image of the night sky  
*(Michael R. Blanton, New York University)*
2. The largest 3-D map of the Universe  
*(David J. Schlegel, Lawrence Berkeley Labs)*
3. The largest map of the outer Milky Way  
*(Constance Rockosi, UC Santa Cruz)*
4. A resource to astronomers and the public  
*(Michael R. Blanton, New York University)*

**SDSS** III

# The largest multicolor image

1. Covers one-third of the sky (14,555 square degrees)
2. Greatest in terms of pixels: 1.2 trillion in each of 5 bands
3. Half a billion detected stars and galaxies:
  - a. *260 million stars*
  - b. *210 million galaxies*
4. Not just really big but also really useful:
  - a. *images are uniformly excellent quality*
  - b. *easily accessible public distribution*

# A milestone in astronomy

1. SDSS-III imaging completes 11-year mission of SDSS camera
2. Builds on the legacy of SDSS-I and -II
3. compare it to National Geographic's Palomar Survey (1958), which is still an important astronomical reference
4. SDSS provides a *digital* rather than photographic image
5. A unique reference for the next decade and beyond

Connie Rockosi

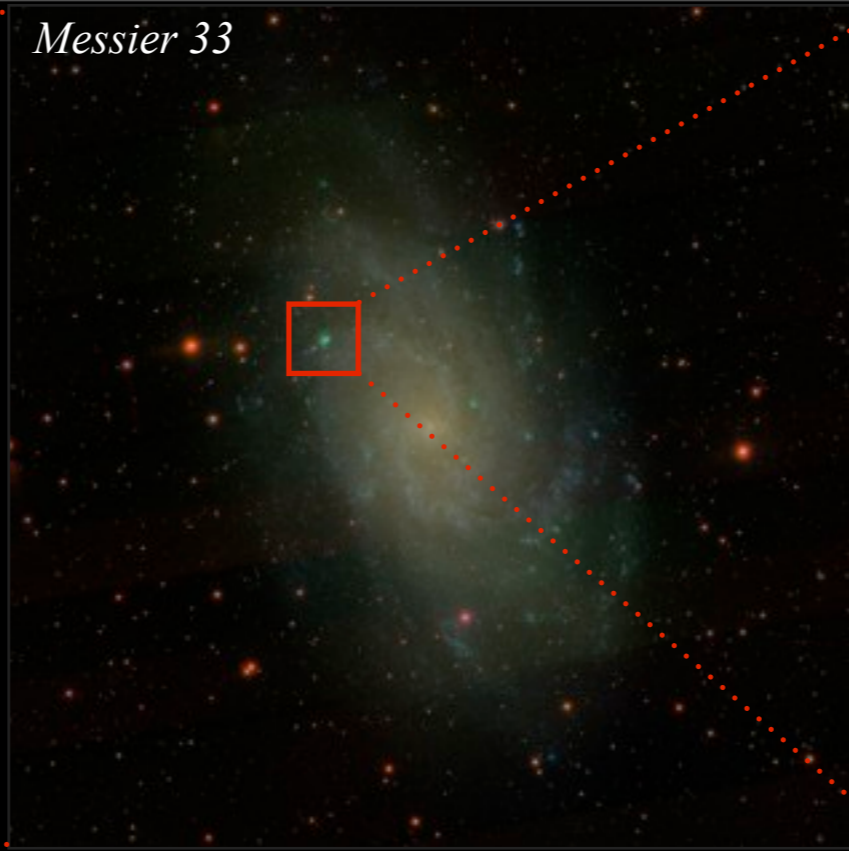

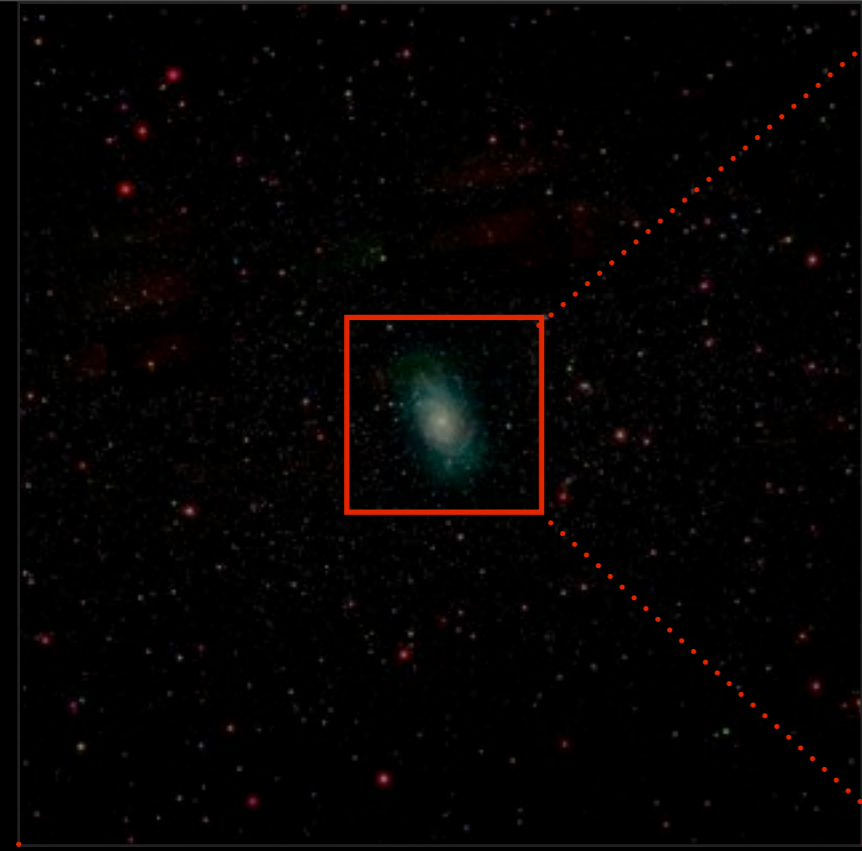

Jim Gunn

*Messier 33*

*NGC 604*

*Southern Galactic Cap*

*Northern Galactic Cap*

*regular galaxies*

*serious train wrecks!*

*minor mergers*

*major mergers*

**SDSS III**

# Needles in a haystack

With DR8, people will now be able to go and search an entirely new area of the haystack

*one of the most distant objects known*

*Fan et al. (2003)*

*a gravitational lens*

*Lin et al. (2008)*

*Southern Galactic Cap*

*Northern Galactic Cap*

# SDSS-III continues through 2014 as a *spectroscopic* program

1. The distant Universe with BOSS  
(*D. J. Schlegel, PI*)
2. The outer Milky Way with SEGUE  
(*C. Rockosi, PI*)

# BOSS in Sloan Digital Sky Survey III

## 2-D $\rightarrow$ 3-D maps

David Schlegel for the SDSS  
Lawrence Berkeley National Lab

1. SDSS mapped million brightest galaxies (done!)
2. SDSS-III mapping more distant Universe  
(2009-2014)
3. On track for new measurements of dark energy

# 20% of SDSS telescope time used to make these 2-D maps

Each point is a galaxy

*Southern Galactic Cap*

*Northern Galactic Cap*

80% of SDSS telescope time used to  
make these 3-D maps

Movie credit: Dinoj Surendran & Mark Subbarao, U Chicago and Adler Planetarium for the SDSS

80% of SDSS telescope time used to  
make these 3-D maps

... but this is the “nearby” Universe

Movie credit: Dinoj Surendran & Mark Subbarao, U Chicago and Adler Planetarium for the SDSS

# Effect of dark energy on the history of the Universe

**SDSS** III

# Effect of dark energy on the history of the Universe

Measure scale of Universe to 4% accuracy from SDSS-I

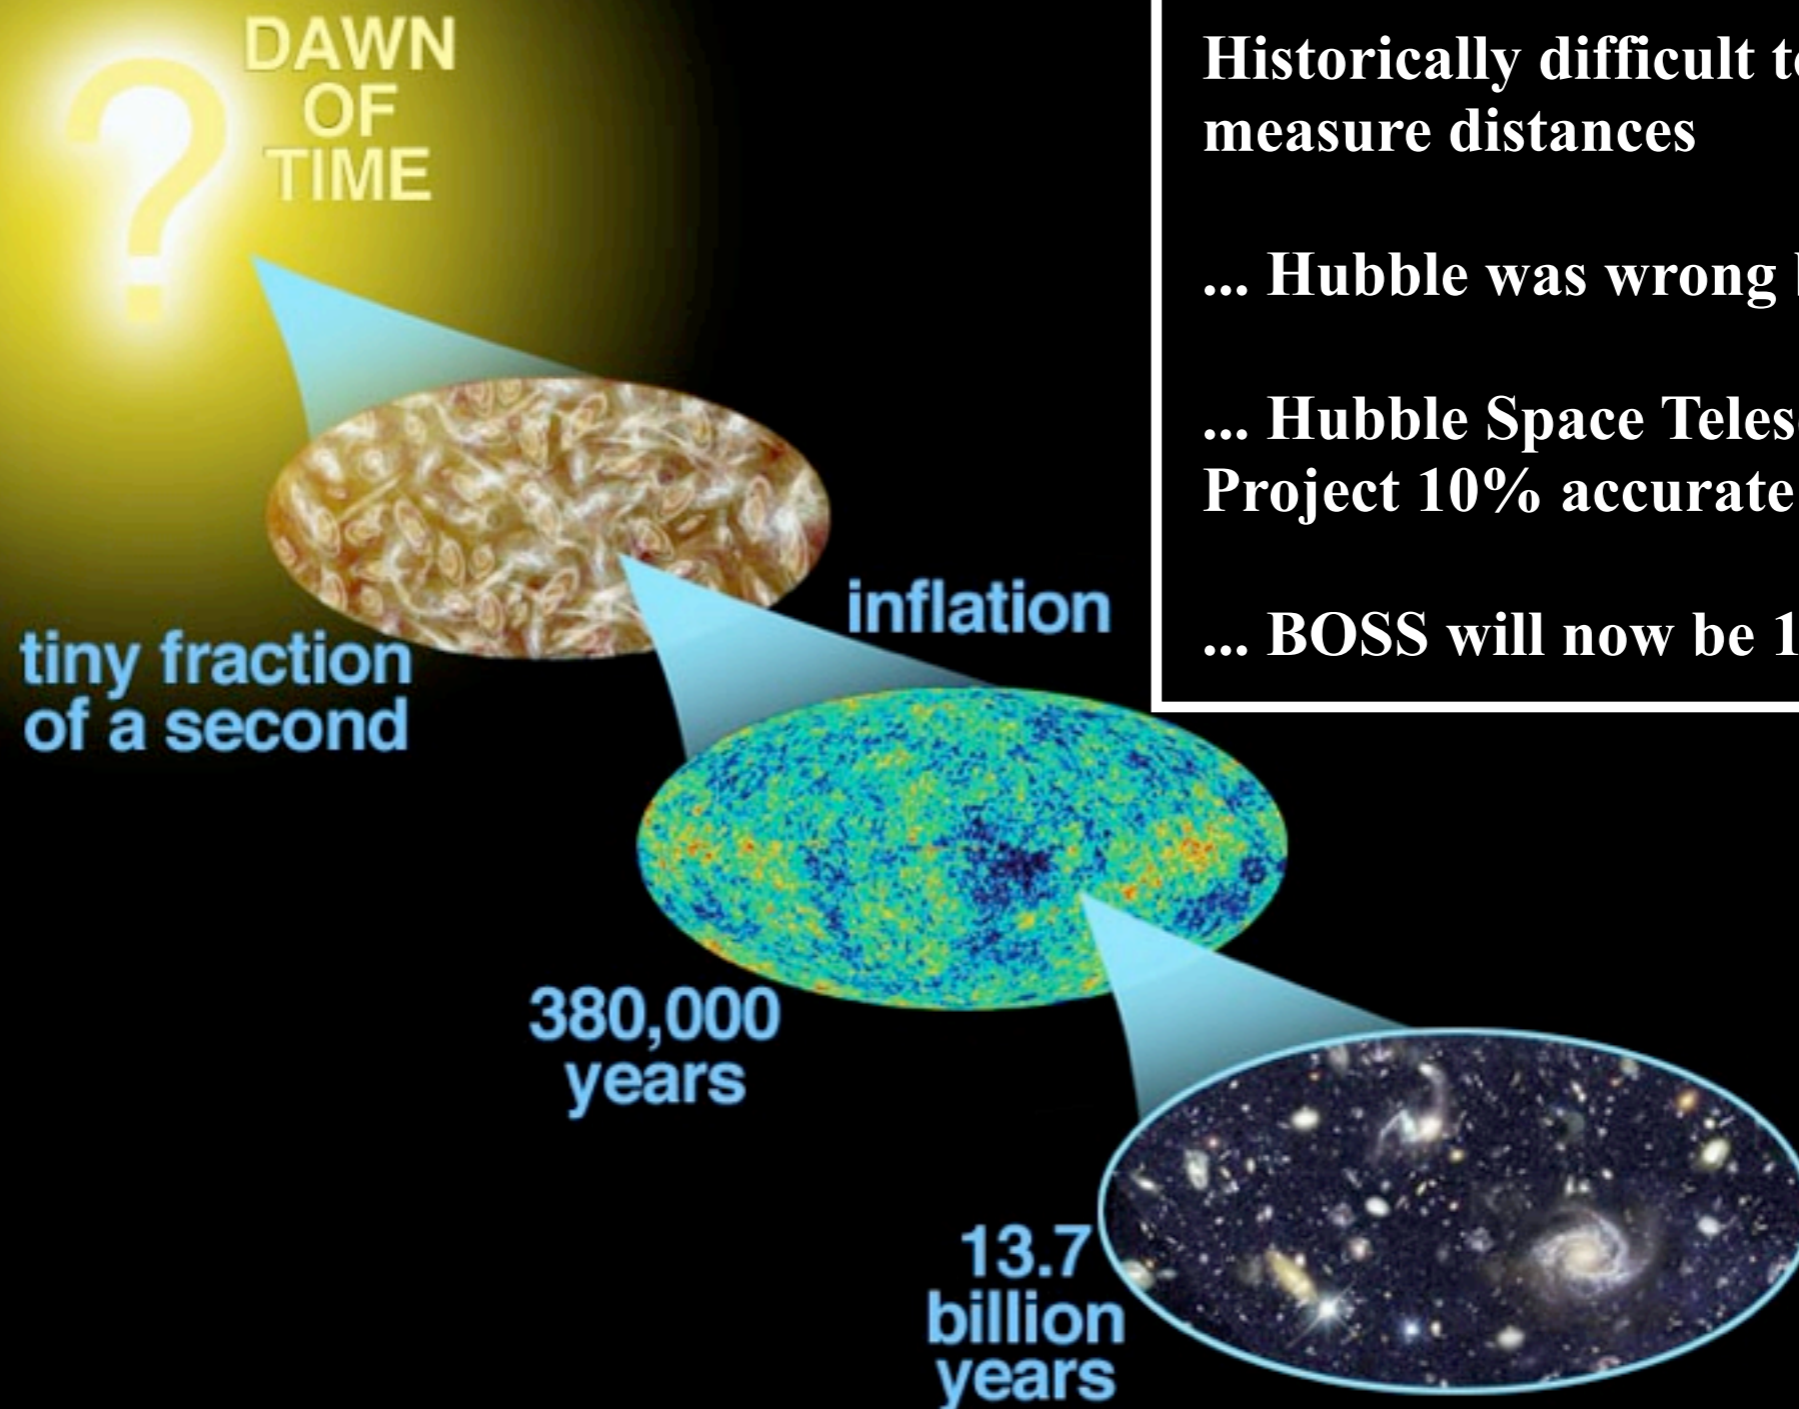

**SDSS** III

# Effect of dark energy on the history of the Universe

# Effect of dark energy on the history of the Universe

Historically difficult to accurately measure distances

... Hubble was wrong by 700% in 1929

... Hubble Space Telescope Key Project 10% accurate

... BOSS will now be 1% accurate

**SDSS** III

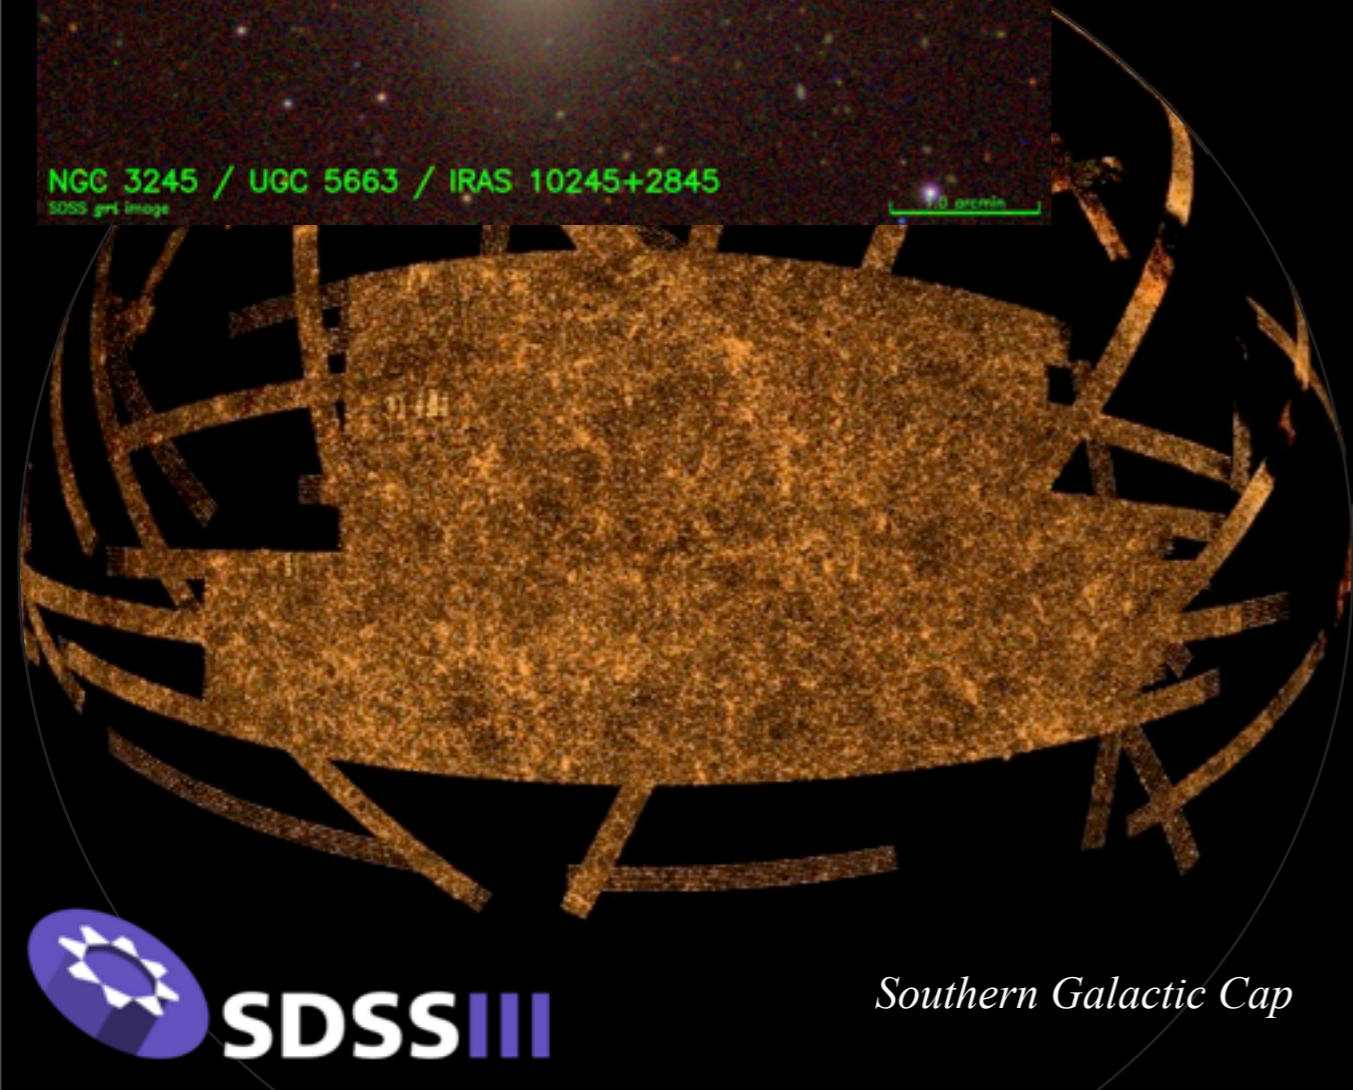

SDSS-III 3-D map:

From the 2-D image, select the 1% reddest galaxies...  
take a spectrum... get a distance

SDSS-III 3-D map:

From the 2-D image, select the 1% reddest galaxies...  
take a spectrum... get a distance

*Southern Galactic Cap*

*Northern Galactic Cap*

# SDSS-III 3-D map:

From the 2-D image, select the 1% reddest galaxies...

# SDSS-III 3-D map:

Extend from 1 billion (“nearby”) to 7 billion light-years

**SDSS III**

# SDSS-III 3-D map:

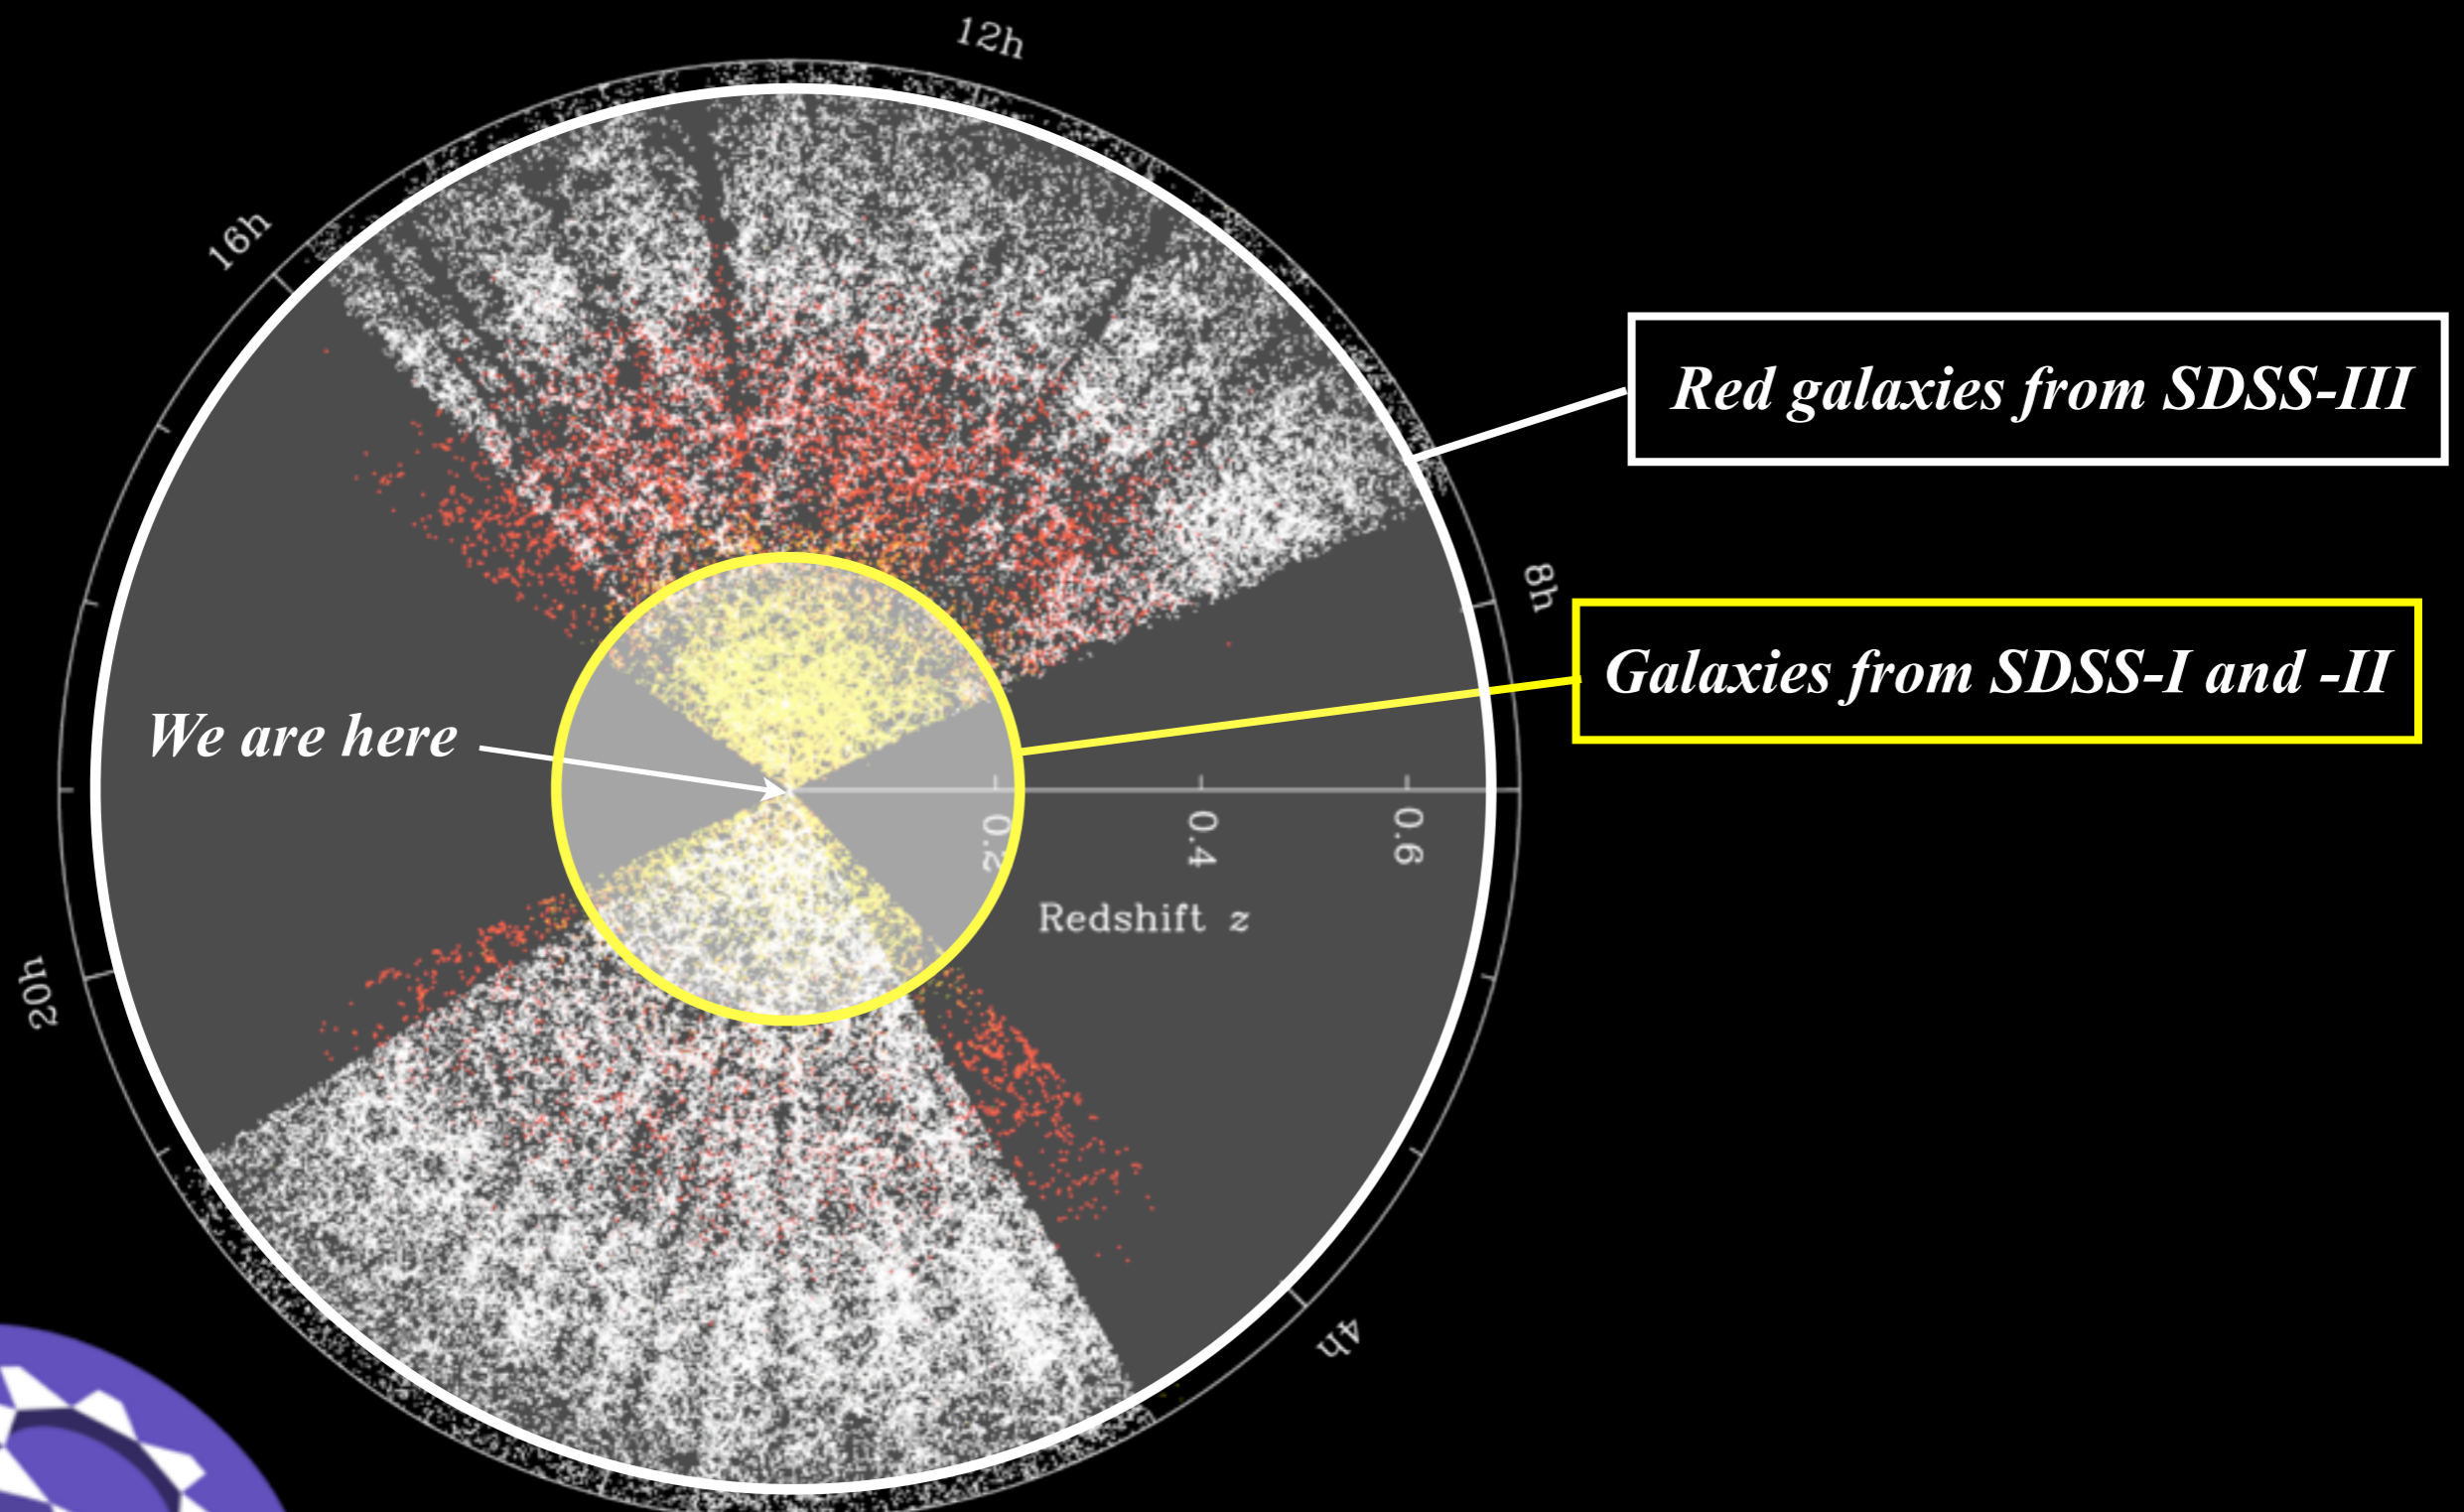

Extend from 1 billion (“nearby”) to 7 billion light-years

**SDSS III**

# SDSS-III 3-D map: Extend from 1 billion (“nearby”) to 7 billion light-years

SDSS-III as of today:

- *After 1 year, larger than all galaxy surveys (except SDSS-I !)*

Coming soon!

- *Precision measures of dark energy from 3-D galaxy maps*

SDSS-III completion in 2014:

- *Largest 3-D map of 1.5 million galaxies*
- *1% accurate probe of dark energy in distant Universe*

# SEGUE-2

## Mapping the Distant Milky Way

Constance Rockosi

*University of California, Santa Cruz*

*UCO/Lick Observatory*

# Largest Map of the Outer Galaxy

A picture of our Galaxy

# Learning How Galaxies Grow

*Cosmology predicts: satellite galaxies fall in to grow a galaxy like the Milky Way*

*Satellites fall in, stars are pulled out along streams and become part of the galaxy.*

*Confirmation of this picture motivated the SEGUE survey in SDSS-III to learn more about these stars and how galaxies grow.*

*A “theoretical galaxy” like the Milky Way. Image credit: Sandip Sharma from computer models by K. Johnston and J. Bullock*

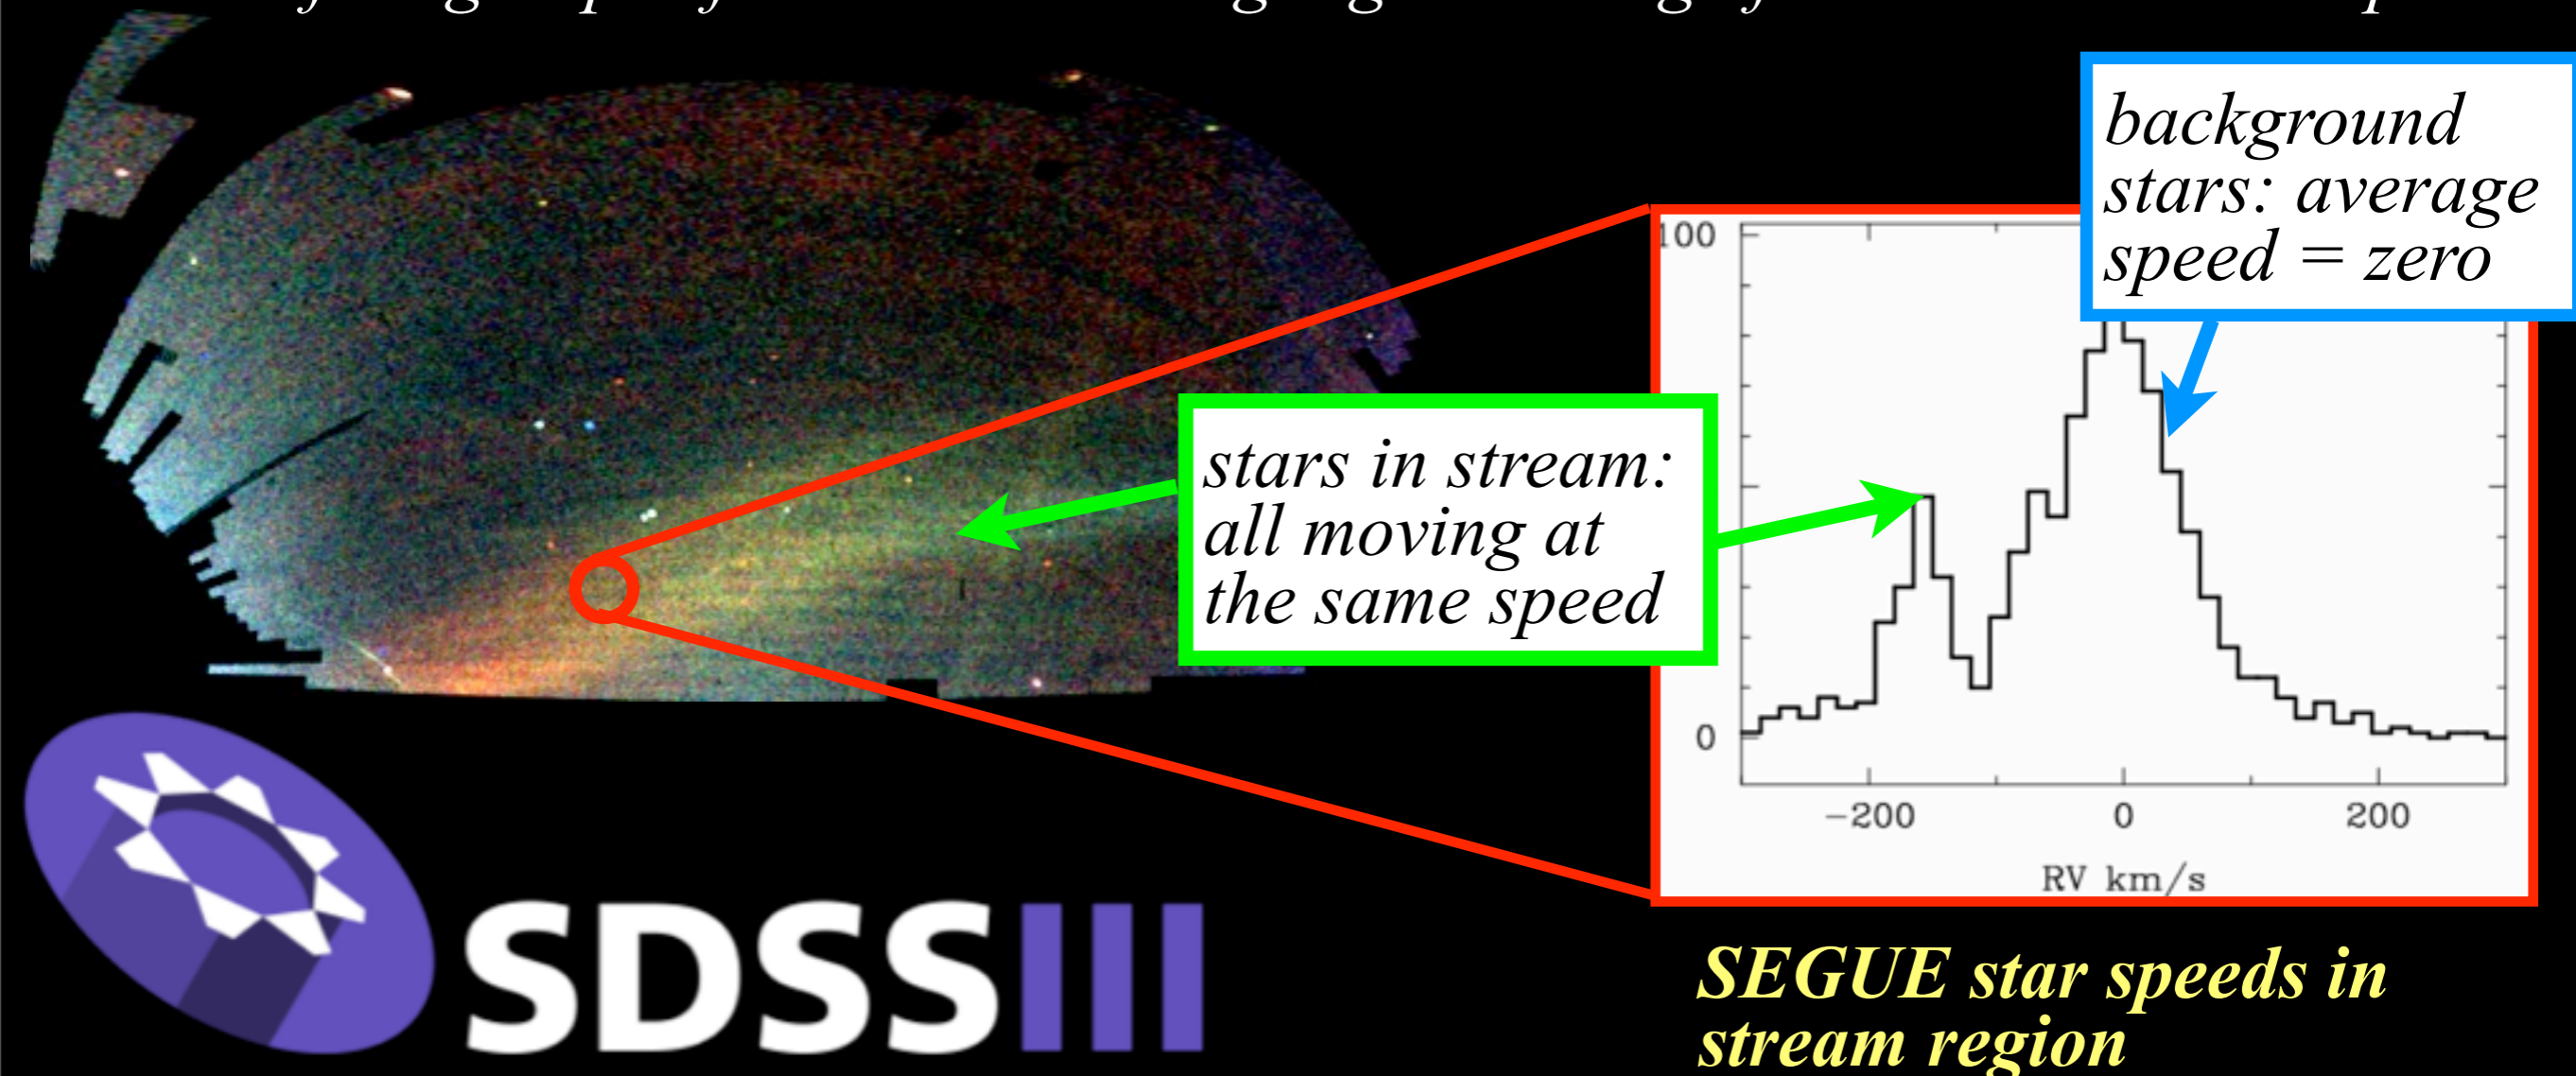

*Image credit: V. Belokurov*

**SDSS III**

# SEGUE-2

1. Spectroscopy of 118,000 stars in our Galaxy
2. With SEGUE-1, the total SEGUE sample in DR8 is 358,000 stars
  - a. *Doppler velocity: how fast the stars are moving*
    - i. *measure total mass of the Galaxy, including the dark matter we can't see*
    - ii. *find groups of stars still moving together long after a stream has dispersed*

# SEGUE-2

b. Learn what stars are made of

i. identify chemical elements in stars

ii. fingerprint the environments in which the stars were born

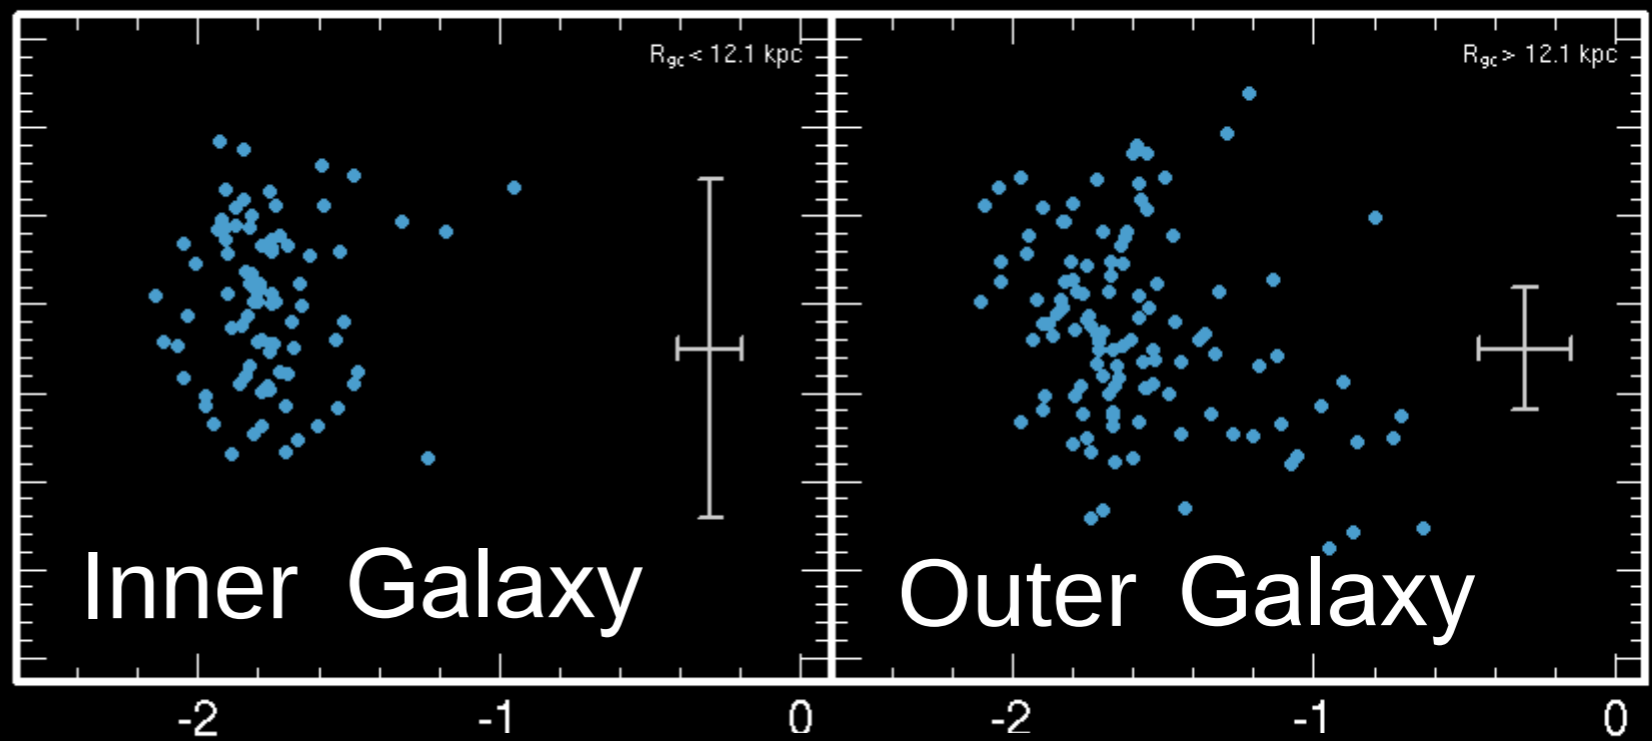

iii. identify different kinds of satellites that fell in to the galaxy: big, small; recently, long ago

*Credit: Schlafman (323.02D)*

Image credit: NIST

How fast gas turned into stars

Fraction of hydrogen gas turned into heavier elements when stars were born

SDSS

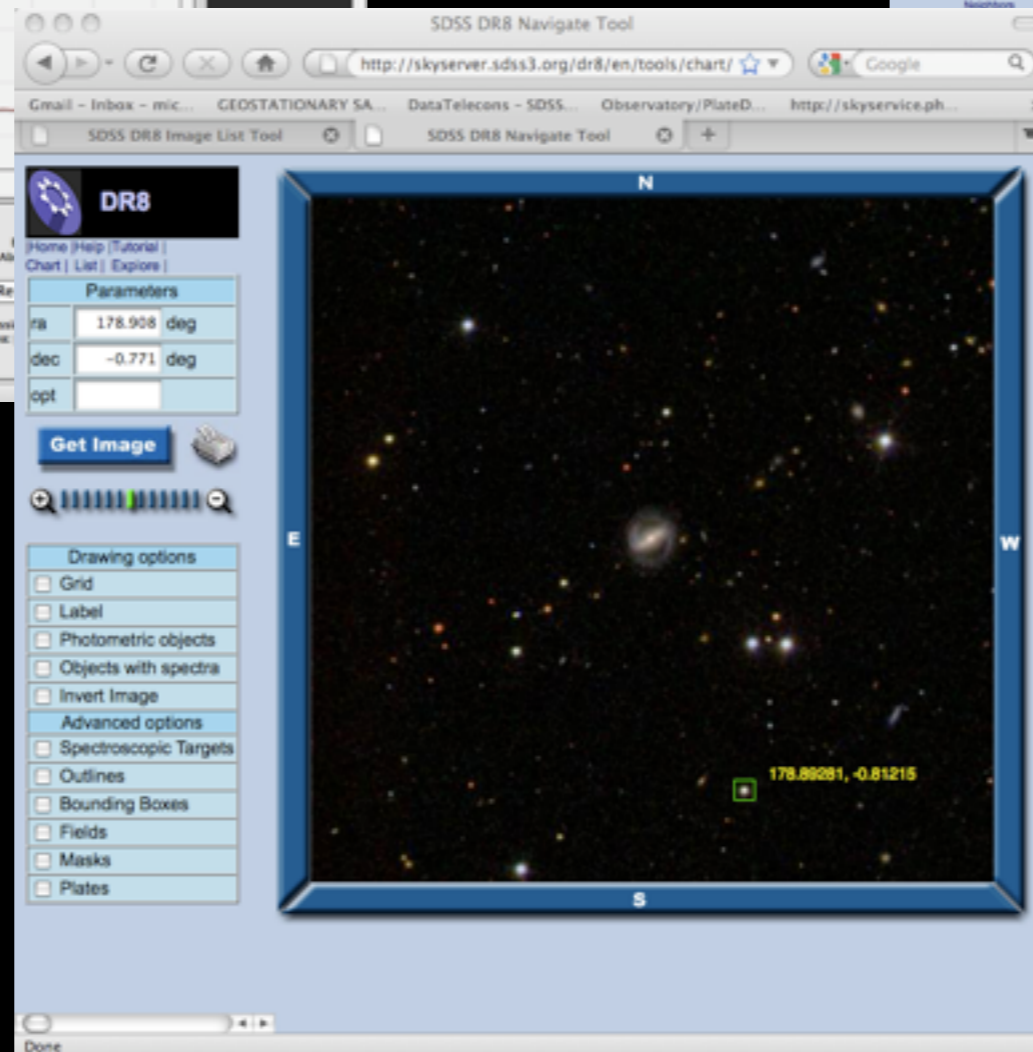

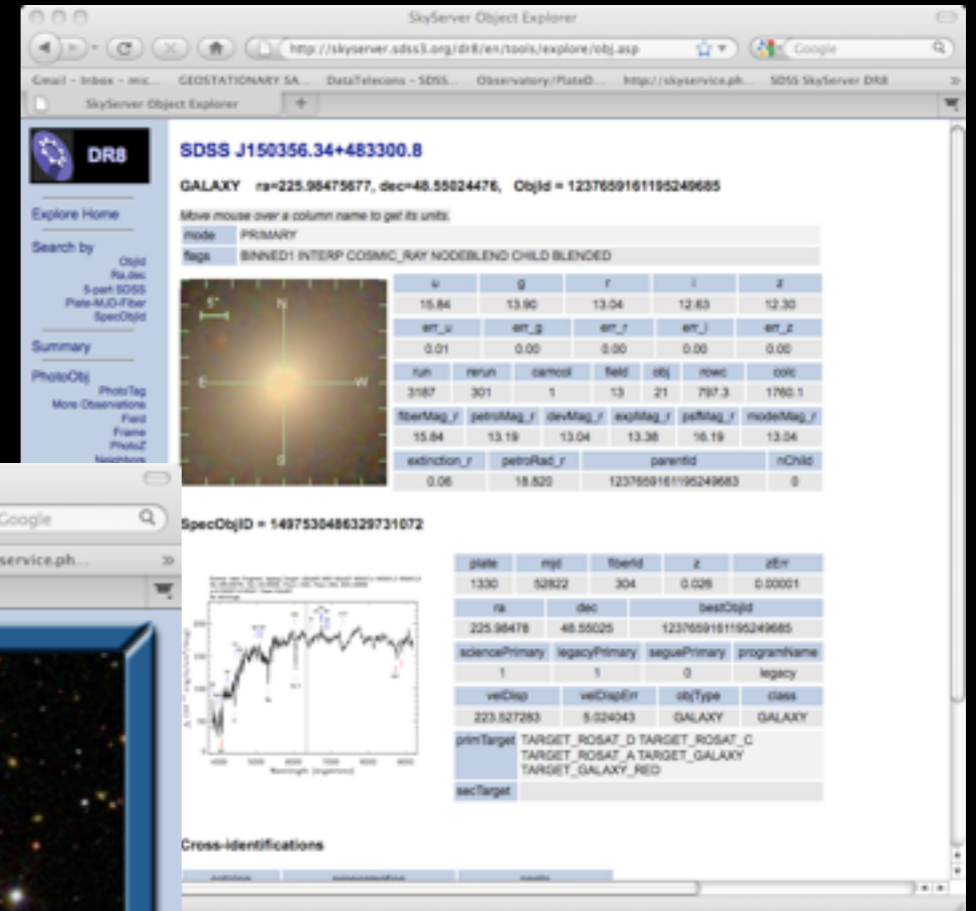

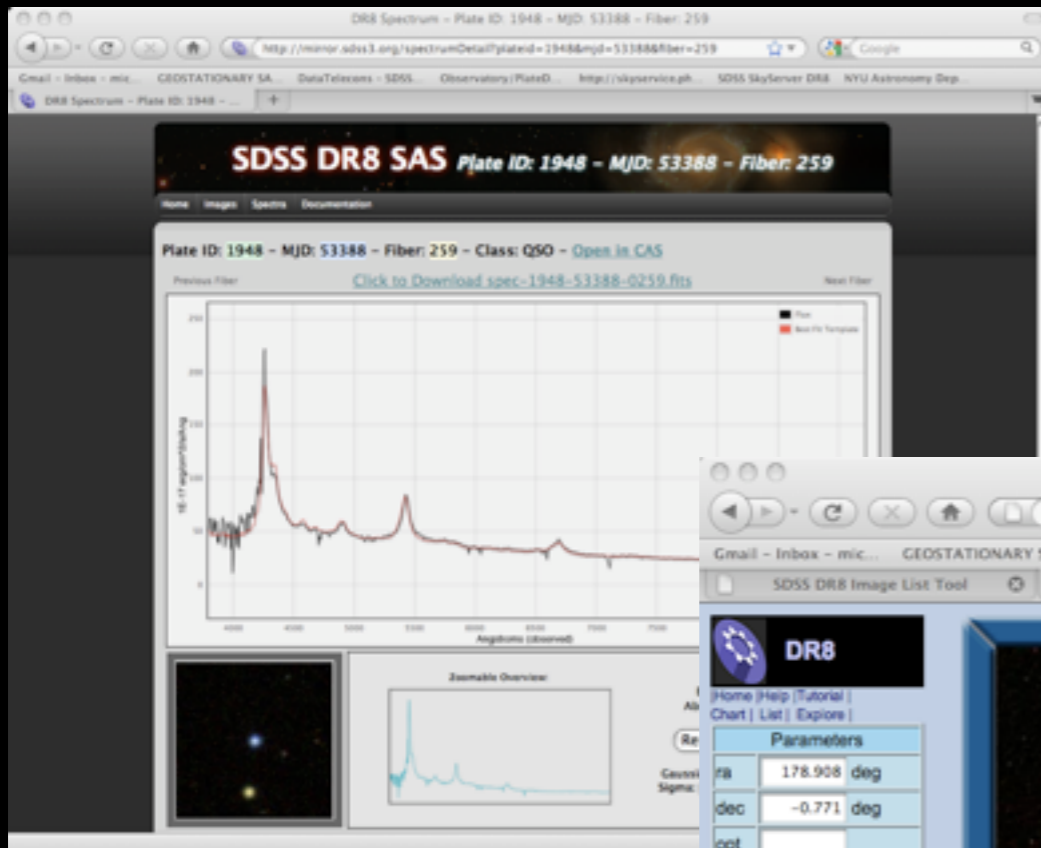

# Data Release 8

1. 30 terabytes of images total
2. 470 million stars and galaxies cataloged
3. 1.8 million spectra
4. Uniformly good quality
5. Results accessible to professionals and amateurs alike

# SkyServer and Science Archive

<http://data.sdss3.org>

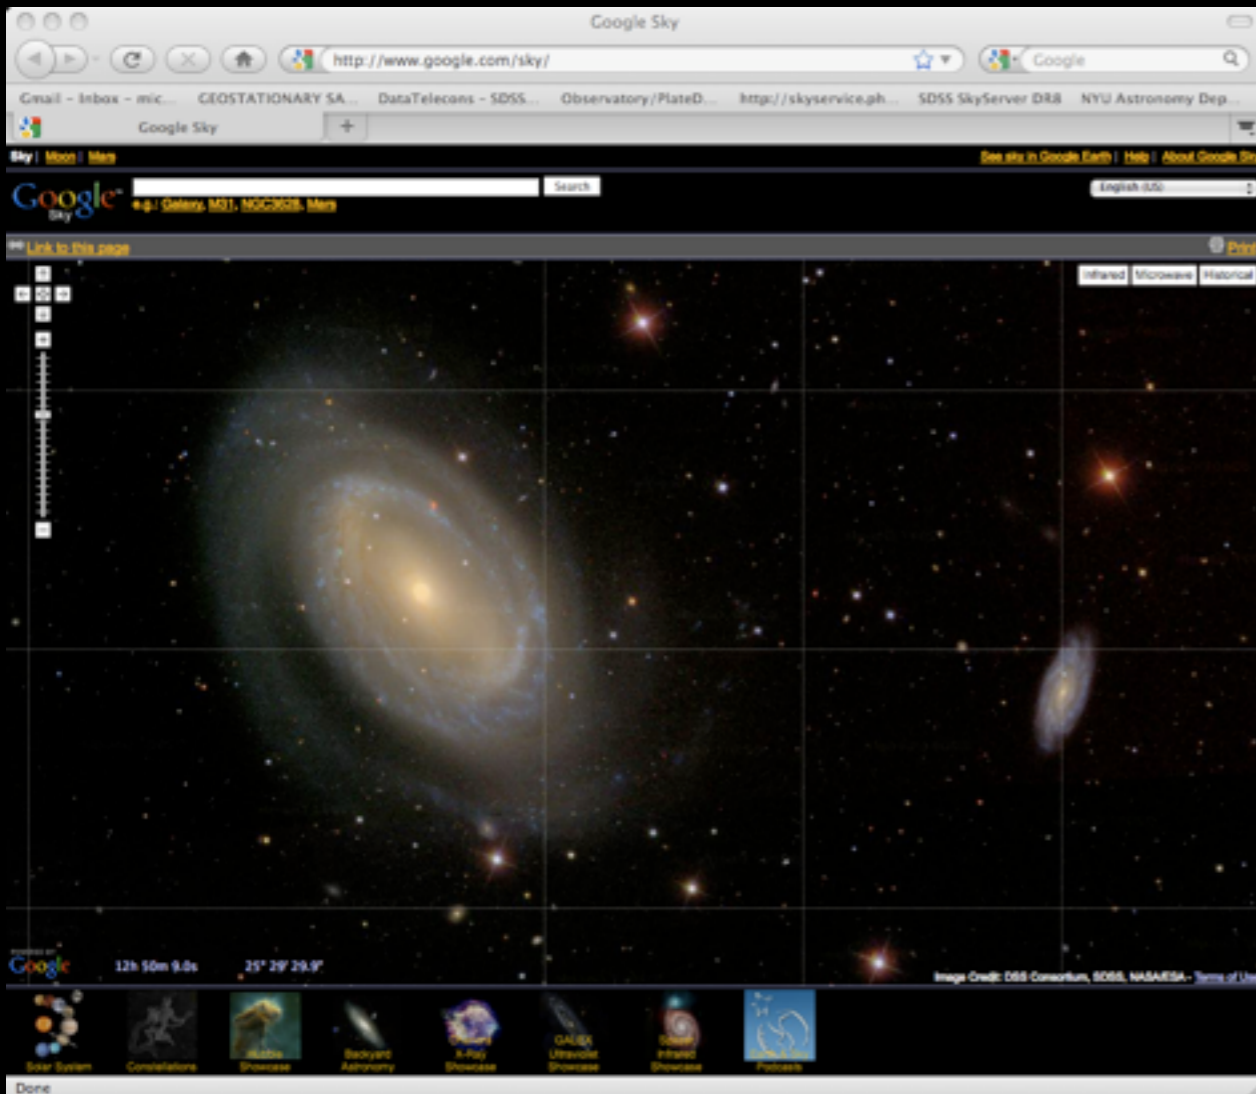

<http://skyserver.sdss3.org>

# SDSS III

# Primary data source for: Google Sky, World-Wide Telescope, Galaxy Zoo

# Distribution lets public into the act

*e.g. Hanny's Voorwerp, which you heard about yesterday: discovered in 2007 by an amateur using SDSS imaging in GalaxyZoo*

# Future data releases through 2014

1. BOSS: *three-dimensional maps*
2. MARVELS: *a search for planets around other stars*
3. APOGEE: *Milky Way studies using infrared light*

*literally thousands of papers based  
on public SDSS data so far: a few  
dozen being presented this week, on  
the very smallest stars as well as the  
most massive black holes*

# Many people, many years

Funding for SDSS-III has been provided by the Alfred P. Sloan Foundation, the Participating Institutions, the National Science Foundation, and the U.S. Department of Energy. The SDSS-III web site is <http://www.sdss3.org/>.

SDSS-III is managed by the Astrophysical Research Consortium for the Participating Institutions of the SDSS-III Collaboration including the University of Arizona, the Brazilian Participation Group, Brookhaven National Laboratory, University of Cambridge, University of Florida, the French Participation Group, the German Participation Group, the Instituto de Astrofísica de Canarias, the Michigan State/Notre Dame/JINA Participation Group, Johns Hopkins University, Lawrence Berkeley National Laboratory, Max Planck Institute for Astrophysics, New Mexico State University, New York University, Ohio State University, Pennsylvania State University, University of Portsmouth, Princeton University, the Spanish Participation Group, University of Tokyo, University of Utah, Vanderbilt University, University of Virginia, University of Washington, and Yale University.
